Abstract (en)

[origin: WO2022150770A1] A method of preventing asthma is presented. A therapeutically effective amount of at least one soy isoflavone is administered to those patients exhibiting a PAI-1 risk genotype of 4G4G or 4G5G. The administration of the at least one soy isoflavone prevents development of asthma in the patients, particularly in pediatric patients which have suffered a viral illness within the first few years of life. Administration of the soy isoflavones to those pediatric patients throughout the viral season is beneficial in preventing the development of asthma.
