Abstract (en)
[origin: WO2022148698A1] The invention relates to an optical device (1) having a plurality of optically active surfaces (2), wherein each of the surfaces (2) can be tilted by means of its own, autonomously controlled manipulation device (3) associated with the surface (2). According to the invention, the manipulation device (3) is designed to position and/or bend the surface (2), and a total controller (4) is provided which controls the manipulation devices (3) such that at least two of the surfaces (2) produce a total surface (5) in a planned and coordinated interaction.
