Abstract (en)  
[origin: WO2022200126A1] The invention relates to a sliding formwork brick (1) for a roof and façade cladding, containing: f) a rectangular panel (2), and g) and upper strip-shaped support (3) which is arranged on the rear face of the panel (2) and extends over the width of the panel (2), wherein h) the support (3) has a support surface (31) which is inclined by an angle of  $\alpha = 3^\circ$  to  $\alpha = 20^\circ$  with respect to a line oriented perpendicularly to the plane of the panel. The invention is characterized in that i) the support surface (3.1) extends to the rear face of the panel (2) and j) a fitting surface (2.1) adjoins the inclined support surface (3.1) at an angle of  $\beta = 90^\circ$  such that the support surface (3.1) and the fitting surface (2.1) can be brought into contact with a rectangular cross-lath of the lathing of the roof and/or façade cladding.
