Abstract (en)

[origin: WO2022157652A1] The present invention is enclosed in the area of rock processing, in particular the processing of rocks such as limestone, slate, marble, granite or kyanite, in pieces, to provide a smoothening or ultimately a change of shape of such pieces of rock through the tumbling of such pieces of rock inside a rotating drum. From such procedure may result rocks with a pebble-like look. The present invention comprises a drum (1) and respective apparatus for the surface processing of rock or mosaic pieces through rotation having a plurality of plates (3) provided inside the drum (1), having a surface with a hardness of at least 300 Brinell and being so provided that such surface faces the interior of the drum (1), each two adjacently provided plates (3) being apart by a predefined distance (d) in respective sides of the plates which are substantially aligned with the rotation axis of the drum (1).
