Abstract (en)
[origin: WO2022156966A1] The invention relates to an angle mirror (A) comprising a housing (2), wherein the housing is equipped with a lower part (3) and a mirror head (1), and the housing (2) can additionally have an intermediate piece (8) and/or a rotary plate (6). According to the invention, an objective (B) is arranged outside of the housing (2) of the angle mirror (A), and the objective (B) is connected to the angle mirror (A) via an optical connection (C). The aforementioned arrangement imparts the angle mirror (A) with the ability to display two images, mainly one image by means of the mirror head (1) and one image by means of the objective (B). Because the image transmission of the objective (B) functions in a currentless manner, preferably via a glass fiber line (30), the objective functions as a backup sight which continues to function even in the event of a power supply failure.
