Abstract (en)

[origin: WO2022157463A1] The present invention relates to a method for transmitting signals used to estimate the position of a user terminal, said method comprising: - transmitting a first signal between a network entity and the user terminal passing via a radio unit, the first signal being intended to enable a measurement relating to a transmission travel time between the entity of the network and the user terminal via the radio unit; and - transmitting a second signal between the network entity and the radio unit, the second signal being intended to enable a measurement of a transmission travel time between the entity of the network and the radio unit; wherein at least one value of a transmission condition for the second signal, termed second value, is dependent on a value of a transmission condition for the first signal, termed first value.
