Abstract (en)

[origin: WO2022155701A1] There is disclosed a system for monitoring the operation of one or more trucks, characterized in that it comprises: at least one truck with a tray; an inertial measurement unit (IMU) arranged on a first surface of the tray, configured to characterize the movement of the tray, obtaining real-time movement data of the tray; a location sensor configured to track the location of the tray, obtaining real-time location data of the tray; at least one processing unit configured to process the movement and location data, obtaining processed data; at least one server configured to receive the real-time movement and location data and/or the processed data; at least one communication unit configured to communicate the real-time movement and location data and/or the processed data from the at least one truck to the at least one server; and a display interface configured to display the real-time movement and location data and/or the processed data to a user wherein the at least one server is further configured to obtain truck operation information from the real-time movement and location data and/or the processed data, said operation information including at least one or a combination of truck status information, truck payload information, truck travel information, truck efficiency information, truck cycle information and truck availability information; and wherein the display interface is further configured to display said truck operation information.
