Abstract (en)

[origin: WO2022159995A1] The invention relates to a transfer system (1) for transferring objects, in particular goods or packages, between users, in particular between deliverers and collectors, in a temporally decoupled manner. The system comprises a compartment unit (2) having a number of compartments (3) at a predetermined location, which compartments (3) are grouped or arranged within an audible or visual perception range of a user who is located at the location. A first and at least one second user interface (12, 21, 21') are coupled for data exchange, or can simultaneously be coupled for data exchange, with an electronic access control system (7, 7'). First and second input means (15, 22, 22') of the first and second user interface (12, 21, 21') are structurally separated and can be used by a first and a second user simultaneously and independently of one another at the location of the compartment unit (2). The access control system (7, 7') is designed in such a way that the first and the second user can access the compartments in an at least partially temporally overlapping and error-free manner.
