Abstract (en)
[origin: WO2022167934A1] A device for spinal column manipulation comprising a first treatment surface which is configured to lie at an oblique angle relative to a horizontal plane and is configured to hold a patient; wherein the treatment surface is provided with a protrusion for supporting a region of the spinal column of the patient to be treated, wherein the treatment surface is movable between an upper position and a lower position via a dropping mechanism, wherein the dropping mechanism comprises a stop which prevents the treatment surface from coming to the below the lower position.
