Abstract (en)

[origin: WO2022167218A1] The invention relates to a method and a device for visualising changeable visual information on at least one light-permeable display (8, 9) which is controlled by an electronic control device (10). According to the invention, a light-permeable display is used which displays the changeable visual information at a certain time or within a certain period selectively either only on a first side (11) of the display (8, 9) or only on a second side (12) of the display (8, 9) facing away from the first side (11) in a way intended to make the changeable visual information purposefully identifiable, the at least one light-permeable display (8, 9) being arranged on the inner side or on the outer side of the window pane (3, 4) or between the two layers of the window pane (3, 4) in such a way and being controlled by the electronic control device (10) in such a way that the first side (11) points towards the inner side and the second side (12) points towards the outer side and the changeable visual information is displayed visibly either from the inner side in the way intended to make the information purposefully identifiable, and visibly from the outer side, but in mirror-inverted fashion, or is displayed visibly from the outer side in the way intended to make the information purposefully identifiable, and visibly from the inner side, but in mirror-inverted fashion.
