Abstract (en)

[origin: WO2022167991A1] An apparatus (10, 110) for detwisting wires or cables (14) wound in spools (13), which comprises: - two coaxial shafts (11, 12), inserted one inside the other and kinematically independent, of which a first shaft (11) is connected to first motor means and is adapted to support, by rotating it about a rotation axis (X), one spool (13), and a second shaft (12) is connected to second motor means and supports, by rotating it about the rotation axis (X), a detwisting cage (15), which is adapted to rotate about the spool (13) with at least one guide (16, 116) for the wire or cable (14) that is being unwound from the spool (13), - at least one take-up guide (17, 117) for the wire/cable (14), which is connected to third motor means in order to rotate about the rotation axis (X) of the cage (15), oscillating toward the guide (16, 116) and/or away from it, - means for coordination of the rotation speed of the first shaft (11) with the rotation speed of the take-up guide (17, 117).
