Abstract (en)

[origin: WO2022167075A1] A brake (10), an elevator hoisting machine (50), and an elevator (100) are presented in this document. The brake (10) comprises two brake pads (12A, 12B) and a brake mechanism which is arranged to engage the brake (10) by moving the brake pads (12A, 12B) away from each other in a first direction to arrange the brake pads (12A, 12B) against brake surfaces (82A, 82B), respectively, and to disengage the brake (10) by moving the brake pads (12A, 12B) towards each other in the first direction to separate the brake pads (12A, 12B) from the brake surfaces (82A, 82B). The brake (10) is adapted to be arranged so that the brake pads (12A, 12B) are between the respective brake surfaces (82A, 82B) in the first direction (X).
