Abstract (en)
[origin: US2022264283A1] Methods, apparatuses, and computer program products are provided to facilitate identification of user equipment that supports connected mode control information for controlling a time to stay in a public land mobile network. Determinations of whether a user equipment supports connected mode control information may be received by a unified data management function via a unified data repository, or a steering of roaming application function, that may be configured with a permanent equipment identifier database. User equipment that supports connected mode control information may cause transmission, via a visited public land mobile network, of an indication that the user equipment supports connected mode control information to a unified data management function associated with a home public land mobile network. An indication that the user equipment supports connected mode control information may be transmitted via a steering of roaming transparent container configured as a secured container.
