Abstract (en)  
The invention relates to a framework construction and a method for mounting a framework construction. The frame construction is supported by vertical support elements tensioned between a supporting and an eave or roof structure such that an adjustable leg at the lower end of the vertical support element and the upper end of the vertical support element form the sole points of support of the framework construction after the tensioning. A working area entity is assembled on at least two adjacent bracket elements such that the assembly of the working area entity is performed while the at least two adjacent bracket elements are in a lower vertical position near to the ground. After assembling the working area entity, it is mounted at the desired working height by adjusting the elevation of the at least two adjacent bracket elements by moving the at least two adjacent bracket elements along the longitudinal axis of the vertical support elements from the lower vertical position close to the ground to the desired working height near the upper end of the vertical support element.
