Abstract (en)
[origin: WO2023052273A1] The present invention relates to a closure device (1) for closing a container, the closure device comprising a base element (2), the closure device comprising a closure cap (8), and the closure device (1) comprising an anchor ring (12) and a connecting means (13). According to the invention, the base element (2) has an additional support means (14), said support means (14) being positioned axially between a fastening means (7) and a first guide means (6), said support means (14) comprising a first surface element (15) having a surface normal (16), the surface normal (16) pointing in the direction of a pouring plane, the closure device (1) being designed in such a way that, when the closure device (1) is open, the closure cap (8) can be brought into a first position in which the closure cap (8) rests neither against the first surface element (16) nor against a first edge (17) delimiting the first surface element, and into a second position in which the closure cap (8) rests against the first surface element (16) or against the first edge (17) or against the first surface element (16) and the first edge (17), the closure cap (8) being mounted in the second position so as to be stabilised with respect to the base element (2).
