Abstract (en)

A computer-implemented method (100) for determining feed mixing unit control data (46) for a mixing unit (42) of a feed mixing appliance (24) is proposed. The determination is based on a net energy model for animal nutrition and considers additional animal health status data (16) as well as environmental conditions data (18) of a livestock (20) for a more precise calculation of an actual energy demand (228) of the animals (14). The feed mixing unit control data (46) comprises data regarding volumes and ratios of raw materials (10) and additives (12) as well as mixing process control data and is calculated such that a net energy (226) of a produced feed mix (22) is equal to an actual net energy demand (228) of a livestock (20). In addition, a feed mixing appliance (24) and service platform model is proposed wherein the control unit (40) along with a feed formula database (48) is centrally located at a cloud computing site.
