Abstract (en)  
[origin: WO2022195642A1] The present invention concerns a foundation system for the realisation of prefabricated structures, in particular for the realisation of modular parking lots, consisting of - a first framework, comprising at least a first level of a prefabricated structure, comprising at least three columns (20) arranged aligned at a predetermined distance along a direction, a diagonal rod (21) being arranged between the head of each column (20) and the foot of the adjacent column (20), a lower beam (19) and an upper beam (22); a second framework comprising a plurality of support elements (10'), in a number corresponding to the number of said columns (20), each support element (10') being arranged under a corresponding column (20), each support element (10') being adapted to receive the concentrated/point loads of the corresponding column (20) and to distribute such concentrated/point loads over a wider area.
