Abstract (en)

A safety lock (100) comprises: a lock assembly (102) having a latch bolt (104); a latch bolt actuating mechanism having two drivers (130, 132) on opposing sides of the lock assembly; and a blocking mechanism (134) configured to be selectively mounted on opposing sides of the lock assembly to prevent a respective driver from moving the latch bolt. The latch bolt actuating mechanism comprises: a first spindle (110) extending through the lock assembly and rotatable in an unlocking direction to unlatch the latch bolt, a second spindle (112) extending away from the first spindle and being unable to be rotated in the unblocking direction when the blocking mechanism is in a blocking state; spindle followers (114, 120) mounted on the adjacent ends of the spindles; and coupling means (118, 122) for coupling the spindle followers such that a rotation of the second spindle in said unlocking direction causes a rotation of the first spindle in said unlocking direction.
