Abstract (en)  
[origin: WO2022200421A1] The invention relates to an actuation handle (1) for components such as doors, windows, and the like, comprising at least one handle (2) with a recess (2.3) which is arranged in a neck section (2.1) of the handle (2) and with a polygonal actuation section (3) which extends along an actuation axis (BA). A clamping device (4) is received in the recess (2.3) in order to produce a rotationally fixed connection, preferably a releasable connection, between the handle (2) and the polygonal actuation section (3). The clamping device (4) has at least one clamping body (4.1) with a through-opening (4.1a) for passing through the polygonal actuation section (3) and at least one clamping frame element (4.2, 4.2') which adjoins the polygonal actuation section along the actuation axis (BA), wherein the clamping frame element (4.2, 4.2') surrounds the polygonal actuation section (3) and can be operatively connected thereto in a force-, form-, and/or friction-fit manner. Advantageously, the clamping device (4) has a spring and holding element (4.3) which is connected to the clamping body (4.1), wherein the at least one clamping frame element (4.2, 4.2') is received between the clamping body (4.1) and the spring and holding element (4.3) by means of the spring and holding element (4.3) and is pivotally mounted on the polygonal actuation section (3), and a spring force (F) can be applied to the clamping frame element.
