Abstract (en)

[origin: WO2022208176A1] Systems, methods, apparatuses, and computer program products for cell re-selection are provided. One method may include receiving radio mapping information between tracking area identifiers of tracking areas neighboring a served cell and a list of physical cell identifiers associated with each tracking area associated with physical cell identifiers corresponding to a neighbor cell of the served cell. Slice assistance information may be received from a network entity associated with the apparatus mapping one or more network slices and at least one of one or more tracking area identifiers of tracking areas in a user equipment registration area or one or more tracking area identifiers of tracking areas neighboring the user equipment registration area supporting the one or more network slices. The radio mapping information and the slice assistance information may be used in a cell re-selection process.
