Abstract (en)

Disclosure relates to a cooking appliance. The cooking appliance may include a casing (100, 200) having a cavity (S1) and an electric chamber (S2) therein, and a door (300) disposed in front of the casing (100, 200) to open and close the cavity (S1). A cooling fan module (410) may be disposed at the electric chamber (S2), and may suck external air and discharge the air to an exhaust port (282) in front of the casing (100, 200). A bottom spacer (215) protrudes on a lower portion of the casing (100, 200), and the bottom spacer (215) spaces a lower surface of the casing (100, 200) and a seating surface on which the casing (100, 200) is seated, from each other to form an intake port (G1). At this point, a first air flow path (AC1) is formed at the lower portion of the casing (100, 200) so that air introduced through the intake port (G1) flows to a rear space of the casing (100, 200), and a second air flow path (AC2) connecting the first air flow path (AC1) and the electric chamber to each other may be formed at the rear space of the casing (100, 200). Through the intake port (G1), air introduced from the front space of the cooking appliance may flow between the cooking appliance and the kitchen furniture. Therefore, even when the cooking appliance is installed in a built-in manner, cooling of the cooking appliance may be efficiently performed.
