Abstract (en)
[origin: EP4318919A1] A control unit (30) of a power conversion device (100) has a first control mode for controlling circulation current (I_{cc}) circulating among leg circuits (25) for the respective phases in a power converter (1) so that an AC component having a frequency that is an even multiple other than a multiple of 3 with respect to the frequency of a fundamental component of AC is contained in the circulation current (I_{cc}), and determines whether to make the first control mode active or inactive, on the basis of the voltage value of an energy storage element (12).
