Abstract (en)

[origin: WO2022219281A1] The present invention relates to a device for conveying glass sheets travelling one behind the other, comprising at least one roller (103) having a glass-sheet-conveying area (Z), said device comprising actuators (A) located on each side of the conveying area, which can curve the roller in its elastic deformation region while allowing it to be rotated about the fixed centres of the cross-sections thereof, characterised in that the roller comprises a shaft (1030) and a plurality of bending rings (1032) through which the shaft is inserted.
