Abstract (en)
[origin: WO2022219067A1] The invention relates to a displacement body which is configured to be arranged in formwork before a concreting operation. The displacement body has at least one first receiving device, which is configured to keep a rebar extending in a first plane at a distance from the closed shell and/or from an, in particular horizontal, reference plane of the closed shell. The displacement body also has at least one second receiving device, which is configured to keep a rebar extending in a second plane, which is parallel to and spaced apart from the first plane, at a distance from the closed shell and/or from the reference plane of the closed shell. The displacement body also has at least one third receiving device, which is configured to keep a rebar extending in a third plane, which is parallel to and spaced apart from the first and the second plane, at a distance from the closed shell and/or from the reference plane of the closed shell.
