Abstract (en)

[origin: WO202223334A1] The invention relates to a method for producing a drivable region (6) for an at least semi-autonomously operated motor vehicle (1), comprising the steps of: - specifying a drivable trajectory (10), which is formed by a trajectory point sequence (16); - specifying a first boundary (11), which is in the form of a first boundary point sequence (16), for a travel envelope (13), the first boundary having a first lateral distance (A1) from the drivable trajectory (10) and being formed on a first side of the drivable trajectory (10); - specifying a second boundary (12), which is in the form of a second boundary point sequence (17), for the travel envelope (13), the second boundary having a second lateral distance (A2) from the drivable trajectory (10) and being formed on a second side of the drivable trajectory (10); and - producing the drivable region (6) by means of the drivable trajectory (10), the first boundary (11) and the second boundary (12). The invention also relates to a computer program product, to a computer-readable storage medium, and to an electronic computing device (5, 14).
