Abstract (en)  
A container has a frame having interconnected frame members, the frame defining interstices between interconnected frame members, the frame being made of plastic. Panelling includes at least one cellulose sheet, plastic film laid on the at least one cellulose sheet, and an adhesive joint between the plastic film and the at least one cellulose sheet. The composite container is characterized in that the film interfaces the panelling to the frame such that the panelling closes the interstices to form a cavity of the container, and an adherence of the adhesive joint is such that the at least one cellulose sheet is manually detachable from the plastic film.
