Abstract (en)

This application provides a tag locating method and system, and a related apparatus. In the method, a first network element sends first indication information to a location management function network element, where both the first network element and the location management function network element are network elements in a core network. The location management function network element may obtain, based on the first indication information, a result of locating a first tag, and determine location information of the first tag based on the result of locating the first tag. The first network element may obtain the location information of the first tag from the location management function network element. It can be learned that, in the tag locating method, the location information of the first tag can be obtained based on an architecture incorporating a cellular system and a passive or semi-active Internet of Things technology, to avoid extra costs due to repeated deployment of a passive or semi-active Internet of Things locating system.
