Abstract (en)

[origin: WO2022229688A1] The invention is a system consisting of modular elements for making reinforced concrete floors, comprising a plurality of base elements (100) designed to be laid at modular and pre-established distances on a surface to be floored, a plurality of upper elements (300), a plurality of column-shaped elements (200) suited to be positioned vertically on said base elements (100), each column-shaped element (200) being suited to support at least one of said upper elements (300), and wherein at least one closing element or surface (330) is positioned so as to close said column (200), in such a way as to prevent the introduction of concrete inside the column-shaped element (200) itself.
