Abstract (en)

[origin: WO2022234035A1] A computer-implemented method of annotating conventional retina images, the method comprising: receiving a conventional image of a retina, the conventional retina image captured using an image capture device; receiving an associated crosssectional image of said retina, the cross-sectional image captured using a crosssectional imaging system; determining a disease location in an image plane of the cross-sectional image; and generating annotation data for annotating the disease location in an image plane of the conventional image, by projecting the disease location from the image plane of the cross-sectional image into to the image plane of the conventional image, based on a known mapping between the cross-sectional image and the conventional image.
