Abstract (en)

[origin: WO2023280946A1] This computer-implemented method for delivering audio-visual media on-demand allows one or more digital video files to be sequenced and the sequences generated by the sequencing to be indexed, by dividing virtually the one or more digital video files into digital virtual sequences, each bounded virtually by two sequence time markers. The method is intended to produce and select automatically virtual sequences of each digital video file, the file fragments corresponding to the virtual sequences then being able to be extracted from the digital video files in question to be viewed or recorded in a new digital video file.
