Abstract (en)

[origin: WO2022233662A2] A PEF cooking appliance (2) has a cooking vessel (1) fillable with liquid, on which there may be arranged at least two spaced-apart PEF electrodes (5), wherein at least one temperature-increasing body (8, 9, 10) disposed within a treatment region (7) bounded by the at least two PEF electrodes (5) has at least one conductive volume (13) composed of a material having an electrical conductivity higher than the electrical conductivity of water, and wherein the conductive volume (13) has at least one exposed surface region (15, 17). A temperature-increasing body (8) serves for use in a PEF cooking appliance (2), wherein the temperature-increasing body (8) has at least one conductive volume (13) which, apart from at least two exposed, spaced-apart surface regions (15, 17), is embedded into a main body (16, 24, 30, 32, 34) made of electrically nonconductive material. The invention is especially advantageous applicable to domestic PEF appliances.
