Abstract (en)

[origin: WO2022239211A1] This refrigerant storage container comprises: a container body that forms an outer shell; an inflow tube that is connected to the container body and allows a gas-liquid two-phase refrigerant to flow into an upper space inside the container body; an outflow tube that is connected to the container body and allows the gas refrigerant and the liquid refrigerant to flow to outside of the container body from the upper space in the container body; and an anti-wave plate that is provided inside the container body and partitions the inside of the container body into the upper space and a lower space. A plurality of through-holes that allow the upper space and the lower space to communicate with each other and allow the liquid refrigerant to flow into the lower space are formed in the anti-wave plate. The through-holes are formed in an annular shape along an inner wall surface of the container body.
