Abstract (en)

[origin: WO2022242961A1] A labelling device (1, 11, 21) for labelling containers (34) is described, with a transport mechanism (2) for a label carrier strip (3), and with a deflection region (5) which has a dispensing edge element (4) and serves for detaching labels (3a) from the label carrier strip. Since the dispensing edge element is designed such that it has at least a first and a second dispensing edge region (6, 7) which differ in terms of their effective deflection radii (6a, 7a) during the detachment process and can be brought into use alternately, the first dispensing edge region can be selected for use if the carrier strip material consists mainly of paper, and the second dispensing edge region if the carrier strip material consists mainly of a plastic. The labelling can thus be easily adapted to different carrier strip materials without exchanging the dispensing edge element.
