Abstract (en)

[origin: WO2022243206A1] A method for transmitting a digital signal by way of a control means able to cooperate with an information-processing machine, the method comprising: - a first phase of actual movement of an interaction means of the control means, - detection, by a sensor integrated into the control means, of a set of actual positions of the interaction means during the first movement phase, - computation, by a microprocessor integrated into the control means, of a hypothetical movement in relation to a second movement phase of the interaction means consecutive to the first movement phase of the interaction means, said hypothetical movement being computed based on the set of actual positions of the first movement phase, and then - transmission, by said control means, of a digital signal defined based on said hypothetical movement.
