Abstract (en)
The invention relates to a handle lock assembly (10) for a door of a cabinet, the handle lock assembly (10) comprising: a main body (20) having a handle housing (28) extending along a longitudinal axis (X) of the handle lock assembly (10); a handle (30) adapted to move between an unlocked position in which the handle (30) is lifted from the handle housing (28) and a locked position in which the handle (30) is substantially within the handle housing (28); and a lock plug (33) provided at the handle (30). Said handle lock assembly (10) further comprises: at least one geared portion (32) formed on the handle (30), being rotatable within the main body (20) when the handle (30) is lifted; a movable member (24) having at least one toothed portion (242) for rotating a pinion gear (26) by the movement of the movable member (24); a plurality of the engagement holes (243) formed in the movable member (24) meshing with corresponding teeth (322) of the geared portion (32) so as to convert a rotational movement from the handle (30) to a linear movement; a movable bearing member (21) placed within the handle housing (28); at least one pin receiving portion (22) formed on the bearing member (21); and at least one pin (31) formed on the handle (30), attachable to the pin receiving portion (22) when placing an interchangeable handle (30).
