Abstract (en)
[origin: WO2022254327A1] A data acquisition system for a satellite (10) comprises at least one camera (2), a device for controlling ambient parameters and processing radiofrequency signals (3) and a microprocessor (4). The camera (2) can be activated so as to acquire images of the Earth's surface, generating optical signals representative of those images. The device for controlling ambient parameters and processing radiofrequency signals (3) is interfaceable with a first antenna (11) in order to receive radiofrequency signals and manage the ambient parameters/ attitude of the satellite (10), and a second antenna (12) in order to receive radiofrequency signals interpreted by the microprocessor (4) so as to perform operations on the camera (2) or packet uplink/downlink operations.
