Abstract (en)  
[origin: WO2022248781A1] The invention relates to a method, implemented in an engine control device of a vehicle, of monitoring a plurality of adaptation values of at least one parameter, the method comprising the following steps: - calculating (10), for each adaptation value, an individual impact value indicating the impact of said adaptation value on the at least one parameter for a current operating point of the engine; - calculating (12) an overall impact value of the impact all the adaptation values have on said at least one parameter for the current operating point of the engine; - comparing (14) the calculated overall impact value with at least one predefined overall impact threshold value; and - transmitting (16), depending on the result of the comparison (14), an alert signal to a device of the vehicle.
