Abstract (en)
[origin: WO2022253726A1] The invention relates to an assembly comprising at least one electronic tripping device and a contact module (2), said electronic tripping device comprising an electronic trip-triggering element (3), said contact module (2) comprising an electromechanical relay arranged to relay at least one item of information originating from said electronic trip-triggering element (3), first electrical connection means (5) configured to be electrically connected to second electrical connection means which the electronic trip-triggering element (3) comprises, characterised in that said contact module (2) is assembled so as to be removable relative to said electronic trip-triggering element (3) between an assembled position, in which said contact module (2) is mechanically and electrically assembled to the electronic trip-triggering element (3), and a disassembled position P02, in which said contact module (2) is mechanically and electrically disassembled from said electronic trip-triggering element (3), and the contact module (2) and the electronic trip-triggering element (3) are arranged such that switching from the disassembled position (P02) to the assembled position, or vice versa, causes the contact module (2) to be electrically and mechanically assembled to or disassembled from, respectively, the electronic trip-triggering element (3).
