Abstract (en)
[origin: CA3220910A1] The invention relates to a console (40) comprising a main body (41), the front and rear faces of which are connected by a through-passage (41C) closed off by lower (42) and upper (43) crossmembers and left-hand (44) and right-hand (45) risers. A joystick (70), arranged inside the through-passage, extends towards the top from the lower crossmember and, at rest, is rearwardly inclined when viewed from bottom to top. The front face of the main body includes a planar surface (47) onto which the through-passage opens out and which is rearwardly inclined when viewed from bottom to top and which extends continuously over the upper crossmember, where it is provided with a display (80), over the left-hand riser, where it is provided with pushbuttons (100), and over the lower crossmember, where it runs from the through-passage to the lower edge (42A) of the lower crossmember, this lower edge being set back relative to the planar surface.
