Abstract (en)

[origin: WO2023057145A1] An armoured vehicle (1) with an emergency exit hatch (10) is proposed. The vehicle (1) has a vehicle floor (20). The emergency exit hatch (10) is arranged in the vehicle (1) in a closed state in an opening in the vehicle floor (20). The vehicle furthermore comprises a lifting device for opening the emergency exit hatch (10). For this purpose, an actuating element is provided by means of which the lifting device can be actuated. A fastening device (40) is arranged on a side of the vehicle floor (20) that is directed towards an interior of the vehicle (1). The lifting device is then connectable by means of the fastening device (40) and can act on the emergency exit hatch (10) by means of the actuating element. In the process, the emergency exit hatch (10) is raised out of the opening and therefore transferred into an open state.
