Abstract (en)

[origin: WO2022271077A1] The present disclosure relates to a method for producing a medium-dimension construction element, MDCE, of wood, having a width  $W_m$  in the range 3-25 cm and a height  $T_m$  in the range 0.5-4 cm. A plurality of planks (1) are assembled into a precursor block configuration (11), and are glued together. An MDCE is formed by sawing the precursor block (11) along a first and a second plane substantially parallel with the general wood fiber direction, and preferably substantially perpendicular to each other. Thereby, an MDCE (15) comprising material originating from at least two planks along its length is formed which has improved strength.
