Abstract (en)
[origin: WO2022272080A1] A computer-implemented method for scanning a side of an object (22). The method can include determining a scanning pattern for an imaging device (e.g., based on a distance between the side of the object and the imaging device), and moving the controllable mirror (30) according to the scanning pattern to acquire a plurality of images of the side of the object. A region of interest can be identified based on the plurality of images.
