Abstract (en)

[origin: WO2023057144A1] An armoured vehicle with an escape hatch (6) and a lifting device for opening the escape hatch (6) is proposed. To this end, the vehicle has two vehicle floors (4, 7), with the result that an intermediate space (20) is produced between the two vehicle floors. To this end, a first vehicle floor is configured as a hull-side boundary of the vehicle towards the outer region. To this end, a second vehicle floor is configured in the vehicle on the inner side. In a closed state, the escape hatch (6) is arranged in an opening in at least one of the vehicle floors (4) in the vehicle. Furthermore, the vehicle has a drive (2), and the lifting device is arranged in a stationary manner in the intermediate space (20) of the vehicle. The lifting device can then act on the escape hatch (6) by means of the drive (2) in such a way that the escape hatch (6) is lifted out of the opening and is therefore transferred into an open state.
