Abstract (en)

[origin: WO2023275371A1] The present invention relates to a method for monitoring a system, comprising the following steps: i. obtaining timeseries describing the temporal evolution of a parameter of a system between an initial time and a final time, the final time being triggered by the occurrence of an abnormal event affecting the system, ii. for each timeseries, defining an abnormal time period and a normal time period, iii. for each timeseries, determining a metric characterizing each parameter of the series under consideration over the abnormal time period and over the normal time period, iv. determining association rules on the basis of the obtained characterizing metrics, v. validating the obtained association rules, and vi. predicting the occurrence or lack of occurrence of an abnormal event liable to affect a system to be monitored on the basis of the validated association rules.
