Abstract (en)

[origin: WO2023274538A1] Disclosed herein is a method of a network node for determining receiver weights comprising obtaining scheduling information from neighboring network nodes or sectors pertaining to interfering wireless devices associated with the neighboring network nodes or sectors; determining, based on the scheduling information, whether a resource block received from at least one serving wireless device and comprising one or more device specific reference signals is subjected to partial interference; calculating a first covariance value for a first symbol subjected to interference comprising a first device specific reference signal and comprised in the resource block; calculating a second covariance value for a second symbol not subjected to interference and comprising a second device specific reference signal and comprised in the resource block; determining a first set of receiver weights and a second set of receiver weights based on the calculated first and second covariance value respectively.
