Abstract (en)
[origin: WO2023280882A1] A position sensor (10) comprising a supporting structure (10) bearing two elements capable of translational movement relative to one another in a first direction (O20), namely a magnetic-field-emitting element (20) for generating a magnetic field (21), and a magnetic-field-detecting element (30, 31), the magnetic-field-emitting element (20) being arranged in such a way that an orientation of the magnetic field (21), which orientation is considered in a first plane (P) orthogonal to the first direction (O20), changes as a function of a distance (d22) separating the first plane (P) from a first end (22) of the magnetic-field-emitting element (20), the magnetic-field-detecting element (30, 31) being configured to produce a signal (30.1, 30.2) indicative of the orientation of the magnetic field (21). Brake and aircraft equipped with such a detector.
