Abstract (en)  
[origin: WO2023037154A1] The present application describes a rotational sensor (20) that, due to its technical characteristics, features robustness against external disturbances. The proposed rotational sensor (20) is composed of a rotor (205) and a stator (200), the stator (200) being comprised of two rows of stator coils radially disposed in a circular arrangement, and the rotor (205), using a similar matching arrangement, is also characterized by comprising at least one row of target rotors radially disposed in a circular arrangement over the two stator coils.
