Abstract (en)  
[origin: WO2023281070A1] The invention relates to a contact device (1) for making electrically conductive contact with, in particular, two-dimensional contact partners (34), having a contact head (42) which has two contact elements (7, 8) which are mounted on a common carrier (2) so as to be longitudinally displaceable in a sliding direction in order to make contact with the contact partner (34), wherein the contact elements (7, 8) are mounted such that they are movable toward one another or away from one another at least in certain areas. According to the invention, the contact elements (7, 8) are in the form of, in particular rigid, individual parts and are guided on the carrier (2) by at least one slotted guide (19, 20) such that, when the contact elements (7, 8) are slid in toward the carrier (2) in a slide-in direction (25), the contact elements (7, 8) are moved toward one another or away from one another at least in certain areas.
