Abstract (en)

[origin: WO2023280687A1] The invention relates to a display device (2) for optically outputting, externally, an internal operating state of an electrical appliance, wherein the display device (2) is designed to be arranged on the electrical appliance so as to be externally visible, and has at least one discrete luminous spot (4), able to be controlled separately, for outputting the operating state of the electrical appliance. It is proposed for the display device (2), as a representation of a particular operating state of the electrical appliance and on the basis of the operating state, - to activate and/or to deactivate a combination of multiple luminous spots (4) of the display device (2) and/or - to switch at least one luminous spot (4) of the display device (2) back and forth between an activated state and a deactivated state in order to output the operating state of the electrical appliance.
