Abstract (en)

[origin: WO2023281231A1] Method for the authenticated establishment of a connection between an equipment connected to at least one communication network and a server of a service provider, and corresponding devices. The invention relates to a solution for providing a certificate to an equipment in an "edge computing" environment. Existing authentication solutions are not well suited to the context of "edge computing" since they cannot meet the demands required to manage these equipments, which may be deployed in distributed infrastructures but which may, above all, be reconfigured, suspended, removed, reactivated or even reassigned to another master node depending on the requirements to be met. The solution that is the subject of the present invention makes it possible, by reusing components that are already present in a communication network, to reliably authenticate such an equipment by providing it with a certificate the integrity of which cannot be called into question since the trusted third party who issued the certificate is the operator managing the communication network.
